The global Single Phase Metering Chip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Single-phase metering chip is an integrated circuit chip used for power metering. It is commonly used in single-phase power systems to measure and record the consumption of electrical energy. Single-phase metering chips have high accuracy and stability, and can provide accurate energy measurement results. Single-phase metering chips usually have the following main functions: 1. Electric energy measurement: Single-phase metering chips can measure parameters such as current, voltage, and power factor, and calculate the amount of electric energy consumed. 2. Data storage: Single-phase metering chips usually have internal memory that can store measurement data, including parameters such as power consumption, power factor, current and voltage. 3. Communication interface: Single-phase metering chips usually have communication interfaces that can transmit data with external devices, such as energy meters, data collectors or smart grid systems. 4. Anti-counterfeiting function: In order to prevent electric energy theft and fraud, single-phase metering chips usually have anti-counterfeiting functions, such as data encryption and anti-tampering.
