## Abstracts

According to our (Global Info Research) latest study, the global Single Row Tapered Roller Bearing market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Single row tapered roller bearings refer to radial thrust rolling bearings whose rolling elements are tapered rollers. There are two types: small cone angle and large cone angle. The small cone angle mainly bears the combined radial and axial loads, which are mainly radial loads. They are often used in pairs and installed in opposite directions. The inner and outer races can be installed separately. The radial and axial clearance can be adjusted during installation and use; The large cone angle mainly bears the combined axial and radial loads, which are mainly axial loads. Generally, they are not used to bear pure axial loads alone. When configured in pairs (ends with the same name are installed oppositely), they can be used to bear pure radial loads.

Single row tapered roller bearings are separable bearings. The inner components of the bearing (composed of rollers, cages and inner rings) and the outer ring can be separated. Therefore, it can be easily installed on the journal and bearing seat. Tapered roller bearings are suitable for bearing radial loads, unidirectional axial loads and combined radial and axial loads. The axial load capacity of tapered roller bearings depends on the contact angle, that is, the angle of the raceway of the outer ring. The larger the contact angle, the greater the axial load capacity. Single row tapered roller bearings can bear axial load in one direction. And it can limit the axial displacement of the shaft relative to the bearing seat in one direction.
