Abstracts

The global Single Seat Regulating Valve market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The single-seat regulating valve is a common flow regulating valve, also called a single-seat control valve. It controls the fluid by changing the flow rate in the pipeline by adjusting the opening of the valve. Single-seat regulating valve usually consists of valve body, valve disc, valve seat, transmission mechanism and other parts. The characteristics of single-seat control valve are simple structure, small size, light weight and easy maintenance. There is only one sealing surface between the valve disc and the valve seat, so the fluid flow path is relatively simple and is not prone to problems such as blockage or leakage. The single-seat control valve has a wide adjustment range and can meet the adjustment requirements under different flow rates and pressures. It is widely used in fluid control systems in petrochemical, metallurgy, electric power, pharmaceutical, food and other industries.
