Abstracts

The global Single USB Port Print Server market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A single USB port print server is a device that allows sharing USB printers through the network, allowing multiple computers to print to the same printer without direct USB connection. The print server is usually connected to the router or switch through an Ethernet cable, and then the USB printer is connected to the USB port of the print server. After the printer is connected, users on the network can print to the printer as if they were directly connected to the computer, without physically connecting to the printer. A single USB port print server usually supports multiple print protocols, including TCP/IP, NetBEUI and AppleTalk, and can be used for Windows and Mac OS X operating systems. They are usually used in small offices or home offices where multiple users need to access a single printer, or when the printer cannot be directly connected to each computer on the network.
