The global Single-use Membrane Chromatography Systems market size is expected to reach \$ 936 million by 2032, rising at a market growth of 13.2% CAGR during the forecast period (2026-2032).

Single-use Membrane Chromatography Systems are purification technologies that utilize disposable membrane-based adsorbers integrated into single-use flow paths to separate and remove impurities from biopharmaceutical products, enabling rapid processing, simplified operation, and reduced cleaning requirements compared with conventional packed column chromatography systems.

The upstream of Single-use Membrane Chromatography Systems includes suppliers of polymer membranes, functional ligands, single-use plastics, filtration materials, and supporting components such as housings, connectors, and sensors, along with specialized chemistry used to functionalize membrane surfaces for targeted separations. The midstream consists of system manufacturers and solution providers that design and assemble membrane chromatography modules and integrate them into single-use processing platforms, often combining them with filtration and other downstream technologies. Downstream demand is driven by biopharmaceutical companies, biotechnology firms, and contract manufacturing organizations that deploy these systems in purification workflows for biologics, where speed, flexibility, and reduced operational complexity are critical, supported by service providers offering process development, validation, and technical support.

The Single-use Membrane Chromatography Systems market is gaining strong momentum as biopharmaceutical manufacturers increasingly prioritize flexibility, speed,

and cost efficiency in downstream processing. Compared with traditional resin-based chromatography, membrane systems offer faster processing times and simplified operations, making them particularly attractive for flow-through polishing steps and impurity removal. The shift toward single-use technologies across bioprocessing has further accelerated adoption, especially among contract manufacturers and facilities handling multi-product pipelines where rapid changeover and reduced cross-contamination risk are critical. While the technology is not a full replacement for column chromatography in all applications, its role as a complementary solution is expanding, supported by ongoing improvements in membrane performance and scalability. The market is characterized by strong demand from biologics production and increasing alignment with continuous and intensified manufacturing strategies.
