## Abstracts

The global Single-Use Prepacked Chromatography Column market size is expected to reach \$ 589 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

Disposable prepacked chromatography columns are ready-to-use columns in which affinity, ion-exchange, hydrophobic interaction, multimodal, or size-exclusion chromatography media are pre-packed and quality-tested for column efficiency. They are typically supplied in polypropylene housings or validated process column formats with disposable flow paths. Products are specified by column volume, resin type, connector format, and system compatibility. They are widely used in downstream biopharmaceutical purification for resin screening, method development, scale-down modeling, clinical batch production, commercial manufacturing, and quality control sample preparation. The estimated gross margin is approximately 58%.

The core value of prepacked columns is not to replace all traditional in-house packing, but to shift packing, column qualification, and part of cleaning validation upstream to the supplier. This reduces preparation time, variability, and process risk in multi-product and multi-project manufacturing environments. As the number of antibody, bispecific, fusion protein, viral vector, and nucleic acid programs increases, customers place higher value on fast process switching, traceable batch records, and scalability consistency, driving continued adoption in process development, clinical manufacturing, and small- to mid-scale commercial production.

The competitive landscape is dominated by platform suppliers such as Cytiva, Repligen, Merck, and Sartorius, which leverage integrated capabilities in resins, column hardware,

quality documentation, and global GMP supply. Regional and Chinese suppliers mainly compete in commonly used resins, fast delivery, and localized technical support for laboratory and pilot-scale applications. Procurement decisions are influenced by resin performance, column efficiency release criteria, system compatibility, lead time, and validation documentation, rather than price alone.

Future growth is driven by high-throughput process screening, single-use bioprocess systems, CDMO multi-product manufacturing, and domestic substitution. Key constraints include transport stability of large-volume columns, consistency of packing across different resins, cost of disposable formats, and waste disposal considerations. Overall, this remains a relatively small but high-value consumable segment with stable growth, where profitability depends on resin sourcing, packing automation, quality documentation, and depth of customer validation.
