The global Sizing Agents for Paper and Board market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Sizing agents for paper and board are chemical substances applied during the papermaking process to enhance the surface properties of the produced sheets. These agents primarily serve to control the paper's absorbency and improve its resistance to water, which is crucial for optimizing printability and achieving desired performance characteristics. Sizing agents create a protective barrier on the paper fibers, reducing the penetration of liquids and preventing excessive spreading of ink during printing. Common sizing agents include both internal sizing agents added to the pulp and surface sizing agents applied directly to the paper web. Internal sizing agents are often alkyl ketene dimer (AKD) or rosin-based, while surface sizing agents may include starch or other polymers. The choice of sizing agent depends on the specific requirements of the paper grade being produced, such as writing, printing, or packaging papers. Overall, sizing agents play a vital role in tailoring the properties of paper and board to meet the diverse needs of end-users.
