Skeleton Tracking Solution is a technology that utilizes computer vision or sensor fusion to continuously and in real-time identify, locate, and digitize the precise position and orientation of human skeletal joints in three-dimensional space. Its core lies in using algorithms to transform visual or sensor data into a series of physically meaningful skeletal key points (such as the head, shoulders, elbows, wrists, hips, knees, and ankles) data streams. This solution is typically based on depth cameras, RGB cameras, or wearable inertial sensors, accurately capturing human posture, movements, and motion trajectories. Its main applications cover virtual reality interaction, sports science analysis, medical rehabilitation assessment, film and animation production, security monitoring, and intelligent human-computer interaction, aiming to achieve a quantitative understanding and digital reproduction of human movement, providing fundamental data-driven capabilities for upper-level applications.
