According to our (Global Info Research) latest study, the global Skin Phototoxicity Test Service market size was valued at US\$ 923 million in 2025 and is forecast to a readjusted size of US\$ 1496 million by 2032 with a CAGR of 7.2% during review period.

The Skin Phototoxicity Test Service is a specialized evaluation designed to determine whether a substance, when applied to the skin and exposed to specific wavelengths of light (such as ultraviolet [UV] A/B or visible light), triggers a non-immunological toxic reaction leading to skin damage, inflammation, or irritation. This testing assesses the potential of compounds—including cosmetics, drugs, sunscreens, or industrial chemicals—to act as photosensitizers, which absorb light energy and generate reactive oxygen species (e.g., free radicals) or interact directly with cellular components to cause adverse effects. The service employs validated in vitro methods (e.g., using reconstructed human skin models like EpiDerm or 3D keratinocyte cultures) or in vivo approaches (e.g., animal studies with rodents or rabbits, or human volunteer patch tests under controlled light exposure) to measure endpoints such as cell viability, cytokine release, or clinical signs of phototoxicity (e.g., erythema, edema). It is critical for regulatory compliance (e.g., OECD guidelines, FDA/EMA requirements) and safety assessment across industries to prevent light-induced skin harm from consumer or occupational exposures.
