Abstracts

Thermal superconductor material is used as the basic heating unit, and the heating device is in the form of anchor wire. The device organically combines the ground wire with the electric heater, which not only does not occupy space but also achieves the purpose of heating, overcomes the problem of high power consumption of electric heating, and creates a precedent of electric heating technology. The ground wire electric heater uses the principle of thermal cycle to heat and dissipate heat around the room, with uniform temperature, small temperature difference at each point of the room, and hot air circulating from bottom to top, namely, it is hot when it is opened, and the room can rise 10 degrees in 20 minutes, with low use cost, The installation is extremely simple, basically free of maintenance, and easy to remove and carry
