According to our (Global Info Research) latest study, the global SLA-DLP-LCD Light Curing 3D Printer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

SLA-DLP-LCD light curing 3D printers are commercial stereolithography 3D printers, which are made using different light-curing technologies and equipments.

SLA light curing 3D printers use an ultraviolet laser beam to irradiate liquid photosensitive resin to build objects by curing layers. SLA printers generally have high precision and surface quality, making them suitable for manufacturing precision parts and models. DLP light curing 3D printers use the digital projection technology to cure by irradiating images of entire layers on the liquid photosensitive resin. DLP printers print faster and are suitable for producing larger volume products. LCD light curing 3D printers use liquid crystal displays as light sources and masks, with low cost and high resolution, suitable for manufacturing medium-precision parts and models. When choosing SLA-DLP-LCD light curing 3D printers, you can consider factors such as printing accuracy requirements, printing speed, consumable costs, equipment prices, and the availability.
