Abstracts

The global SLA-DLP-LCD Light Curing 3D Printer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

SLA light curing 3D printers use an ultraviolet laser beam to irradiate liquid photosensitive resin to build objects by curing layers. SLA printers generally have high precision and surface quality, making them suitable for manufacturing precision parts and models. DLP light curing 3D printers use the digital projection technology to cure by irradiating images of entire layers on the liquid photosensitive resin. DLP printers print faster and are suitable for producing larger volume products. LCD light curing 3D printers use liquid crystal displays as light sources and masks, with low cost and high resolution, suitable for manufacturing medium-precision parts and models. When choosing SLA-DLP-LCD light curing 3D printers, you can consider factors such as printing accuracy requirements, printing speed, consumable costs, equipment prices, and the availability.

SLA-DLP-LCD light curing 3D printers are commercial stereolithography 3D printers, which are made using different light-curing technologies and equipments.
