The global Slag Wool market size is expected to reach \$ 650 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

Slag wool is a fiber product made from blast furnace slag. Slag wool is the use of industrial waste slag (blast furnace slag and copper slag, aluminum slag) as the main raw material, after melting, a cotton filamentous inorganic fiber high speed centrifugation or blowing method process. In 2024, global Slag Wool production reached approximately 1583 K MT, with an average global market price of around US\$ 322 per MT.

The global slag wool market is anchored in its role as a high-performance insulation material derived from industrial byproducts. Slag wool, also known as mineral wool or stone wool, is manufactured by spinning molten slag and other rock-like materials into fibers. Its excellent thermal resistance, sound absorption, and fireproofing qualities make it a go-to solution across various industries. Common applications include building and construction, where it serves as wall, roof, and HVAC insulation, as well as industrial settings like power plants, refineries, and shipbuilding. The ability of slag wool to effectively reduce energy consumption while enhancing safety attributes has solidified its position in modern infrastructure development.

In recent years, the industry has seen a push toward sustainability and eco-efficiency, reflecting a broader shift across the materials sector. Manufacturers are optimizing production processes to reduce emissions and repurpose more furnace slag, aligning with circular economy principles. Innovations in binder formulations are also underway to address concerns about volatile organic compounds (VOCs) and ensure compliance with increasingly stringent indoor air quality standards. As global construction and
