Abstracts

Bruxism is excessive teeth grinding or jaw clenching. It is an oral parafunctional activity; i.e., it is unrelated to normal function such as eating or talking. Bruxism is a common behavior; reports of prevalence range from 8–31% in the general population. Several symptoms are commonly associated with bruxism, including hypersensitive teeth, aching jaw muscles, headaches, tooth wear, and damage to dental restorations (e.g. crowns and fillings) to teeth. But symptoms may be minimal, without patient awareness of the condition.

According to our (Global Info Research) latest study, the global Sleeping Bruxism Treatment market size was valued at USD 474.1 million in 2022 and is forecast to a readjusted size of USD 608.7 million by 2029 with a CAGR of 3.6% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Increasing prevalence of sleeping bruxism, rise in pediatric population, and changing lifestyles are factors expected to drive market growth over the forecast period.

Availability of therapeutic medicines in the form of antidepressants, muscle relaxants, and others can provide growth opportunities to the market. But high costs of custom-made night guards and lack of treatment options for SB can impede the market.
