Abstracts

According to our latest research, the global Slicer Software for 3D Printing market size will reach USD 2959 million in 2031, growing at a CAGR of 6.5% over the analysis period.

Slicer software for 3D printing is a software tool used to convert 3D models (usually presented in STL or OBJ format) into layered G-code suitable for execution by 3D printers. This process involves decomposing the 3D model into multiple 2D layers and designing the printing path for each layer, including extrusion path, filling mode, support structure, etc. The slicer generates precise G-code to ensure that the printer can accurately follow the 3D model to stack the material or food material layer by layer to finally form the desired 3D solid product. The process includes file import, layer processing, parameter setting and optimization, and generation of executable G-code to drive the workflow of the 3D printer. In the food industry, this technology is used to make edible 3D printed food, complex candy or chocolate products.
