## Abstracts

According to our (Global Info Research) latest study, the global Slide Core Unit market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A slide core unit is a mold component primarily used in resin molding. It's a movable part within a mold, facilitating the production of products with undercuts or complex inner geometries in a single molding process. Although integrating a slide core unit mechanism allows for intricate shapes in one go, it's important to note the potential increase in tooling costs and design issues due to more detailed molds and additional parting lines.

Slide core units are essential for creating undercut areas in plastic molded products, which are shapes that obstruct the normal path of demolding. These units enable the forming of such areas, allowing for the product's removal in one molding cycle. While a simple cup can be de-molded with a standard mold, a cup with a handle necessitates a slide core unit due to the undercut. This technology is also pivotal in producing complex plastic items like construction window frames, door handles, and electronic device housings.
