According to our (Global Info Research) latest study, the global SLO Ophthalmoscopes market size was valued at USD 10 million in 2023 and is forecast to a readjusted size of USD 19 million by 2030 with a CAGR of 9.7% during review period.

Scanning laser ophthalmoscopy (SLO) is a method of examination of the eye. It uses the technique of confocal laser scanning microscopy for diagnostic imaging of the retina or cornea of the human eye. As a method used to image the retina with a high degree of spatial sensitivity, it is helpful in the diagnosis of glaucoma, macular degeneration, and other retinal disorders. It has further been combined with adaptive optics technology to provide sharper images of the retina. SLO employs lasers of different wavelengths that scan across the fundus in a raster pattern to illuminate and record reflectance or fluorescence, point-by-point at high speeds. This scanning technique lessens the need for pupillary dilation. The instrument offers several retinal imaging modalities, including monochromatic reflectance, FA, ICG angiography, and fundus autofluorescence. Although not capable of true color imaging, multiple monochrome laser images taken simultaneously can be combined to create pseudo-color images.

Nidek and Optos (Nikon) are the top 2 companies in global SLO ophthalmoscopes market and account for about 50% of total market share. Geographically speaking, Asia Pacific holds about 35% of global market share, followed by North America with about 30% share. In terms of type, wide field segment holds a main share of about 60%.
