Abstracts

The global SLP PCB market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Substrate-like PCB (SLP) will replace the previous HDI PCB technology and can shorten the line width/line spacing from HDI's 40/50um to 20/35um, that is, the minimum line width/line spacing will be shortened from HDI's 50um to SLP's 30um Within. Affected by the continuous development trend of electronic products such as smartphones, tablets and wearable devices towards intelligence, miniaturization and diversification of functions, the components required to be mounted on PCBs have increased significantly, but the required size, weight and volume have continued to shrink. In this context, PCB wire width, spacing, micro-hole disk diameter and hole center distance, as well as the thickness requirements of conductor layers and insulating layers are constantly decreasing, and traditional HDI is difficult to meet the above requirements due to limited manufacturing processes. Therefore, SLP technology with more stacked layers, smaller line width and line spacing, and can carry more functional modules has become an inevitable choice to solve this problem.

This report studies the global SLP PCB production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for SLP PCB, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2023 as the base year.
