Small-angle laser scattering is a precision instrument used to analyze the size, shape and distribution of particles or molecules in a sample. It infers the microstructural characteristics of a solution, suspension or polymer system by measuring the light intensity distribution of a laser beam scattered into a small angle range when passing through the sample. This technology is particularly suitable for studying the particle size, aggregation state and conformational changes of macromolecules from nanometer to micrometer scales. It is widely used in materials science, biology, chemistry and pharmaceuticals, and provides important quantitative information for understanding the relationship between the structure and performance of complex systems.
