## Abstracts

SIS tissue-repair patch is derived from the porcine small intestinal submucosa (SIS), which is composed of an extracellular matrix (ECM), widely used in soft tissue repair among the whole surgeries. SIS material is obtained from the intestine in a manner that removes all viable cells, but leaves the naturally fibrous and porous nature of the matrix behind. These proprietary processing methods retain the complex architecture and composition of the extracellular matrix, providing not only the structural collagen framework but also the natural non-collagenous ECM components that are essential for cell interaction, function, and ingrowth.
