Abstracts

The global Small Molecule Bovine Bone Collagen Peptides market size is expected to reach \$ 749 million by 2032, rising at a market growth of 8.3% CAGR during the forecast period (2026-2032).

Small molecule bovine bone collagen peptides are active functional peptides extracted from natural bovine bones using bio-directed enzymatic hydrolysis technology. This product achieves the superior characteristic of directly entering the circulatory system without digestion by breaking down large-molecule collagen into highly bioactive low-molecular-weight microfragments. Rich in various essential amino acids, it excels in enhancing bone density, repairing articular cartilage, and improving skin elasticity, making it an ideal choice for modern precision nutrition and bone health. In 2025, global sales of small molecule bovine bone collagen peptides were approximately 45,000 tons, with an average price of approximately US\$9,500 per ton and an overall gross profit margin of approximately 25%-45%. The small molecule bovine bone collagen peptide powder industry chain exhibits significant resource dependence and large-scale characteristics at the raw material end. The upstream mainly comes from bovine bones, a byproduct of the slaughtering and meat processing industry, whose supply is closely related to global beef consumption, slaughter structure, and regional livestock development. Bovine bones need to undergo pretreatment (defatting, crushing, and decalcification) before entering the midstream processing stage. The midstream is the core of the value chain; companies use enzymatic hydrolysis technology to convert collagen into small-molecule peptides with specific molecular weight distributions, and then use membrane filtration, concentration, and spray drying to form standardized powder. The key competitive advantages in this stage lie in enzymatic hydrolysis efficiency, molecular weight control capabilities, and batch stability. Downstream industries include food, health product, and functional ingredient companies, which

typically acquire raw materials through bulk purchases and then compound or brand them according to application needs. Overall, this industry chain exhibits a structure of 'stable upstream resources + midstream technology-driven + differentiated downstream demand,' with midstream processing companies being the core of profits and technological barriers.
