NOR flash memory is a type of non-volatile memory (NVM) used to store data in electronic devices. It usually comes in the form of an integrated circuit and has been widely used since the early 1990s. NOR flash memory consists of FG MOS or FG MOSFET (Floating Gate Metal Oxide Field Effect Transistor). Each FG MOS is an electronic component that can store 0 or 1. This is why these transistors are called memory cells. In NOR flash memory, these cells are arranged in parallel. NOR flash memory is also inherently non-volatile, which means it can permanently store its contents even when it is not connected to any power source (such as a battery or mains).
