Abstracts

Wind turbines harness the power of the wind and use it to generate electricity. When the wind blows, the blades are forced round, driving a turbine that generates electricity. The stronger the wind, the more electricity produced.

Harnessing the power of micro-wind or small-wind turbine systems wind to generate electricity, micro-wind or small-wind turbine systems in an exposed position, can produce more than enough energy to power the lights and electrical appliances in a typical home.

Small Wind Power Generation System use small wind turbines, also known as micro wind turbines which are used for microgeneration of electricity, as opposed to large commercial wind turbines, such as those found in wind farms. Small wind turbines often have passive yaw systems as opposed to active ones. They use a direct drive generator and use a tail fin to point into the wind, whereas larger turbines have geared powertrains that are actively pointed into the wind.
