Abstracts

The global Smart Information Light Pole market size is expected to reach \$ 808 million by 2032, rising at a market growth of 9.8% CAGR during the forecast period (2026-2032).

Smart information light poles are a new type of urban infrastructure that integrates traditional streetlights with various urban information and sensing functions. They typically integrate modules for lighting control, video surveillance, environmental monitoring, information dissemination, communication base stations (such as 5G micro base stations), emergency broadcasting, and IoT access. Through unified power supply, unified pole design, and platform-based management, smart information light poles can achieve real-time data collection, remote control, and multi-system collaborative operation, significantly improving the utilization efficiency and intelligent management level of urban public facilities. These light poles are important carriers for smart cities, smart transportation, and refined urban governance, and are gradually upgrading from simple lighting facilities to nodes of urban digital infrastructure. Sales volume in 2025 is projected at 350,000 units, with an average price of US\$1,100, a capacity utilization rate of 89%, and a gross profit margin of 40%.

Initially, smart information light poles were primarily implemented as energy-saving lighting or image projects, but the current market logic is shifting?their core value is no longer the light itself, but the 'pole.' As smart city construction enters a phase of refined inventory management, cities' demands for capabilities such as video sensing, communication coverage, environmental monitoring, and emergency management are constantly increasing. Roadside poles have become ideal carriers for low-cost, high-density deployment of urban sensing and communication nodes. Consequently, smart information light poles are gradually shifting from single-equipment procurement to a systematic investment of 'pole + module + platform,' significantly increasing project value, lifecycle, and technological stickiness.

Despite clear demand, the market expansion of smart information light poles is not linear; its speed of development is highly dependent on local government financial capacity, integrated investment, construction, and operation models, and the maturity of industry standards. In some cities, excessive functional overlap and high inter-departmental coordination costs have led to longer project return cycles, hindering large-scale replication. The key to the future market lies not in functional stacking, but in modular design, unified interfaces, and the ability to implement operational scenarios. Solutions that can be reused across departments, have stable operation and maintenance, and data monetization pathways will have a greater chance of standing out in the new round of urban renewal.
