## Abstracts

According to our (Global Info Research) latest study, the global Smart Multi-Storey Parks market size was valued at US\$ 2148 million in 2025 and is forecast to a readjusted size of US\$ 2559 million by 2032 with a CAGR of 2.7% during review period.

Smart Multi-Storey Parks refer to modern parking facilities that utilize automated systems, information technology, and intelligent scheduling to manage vehicle storage and retrieval across multiple vertical levels. Unlike traditional parking garages or surface lots, smart multi-storey parks deploy mechanical systems (such as lift-and-slide, vertical circulation, or tower stacking mechanisms) combined with Internet of Things (IoT), Artificial Intelligence (AI), big data management, and smart payment technologies. These systems maximize land utilization, significantly improve parking efficiency, reduce operational costs, and enhance user experience. Features typically include smart navigation, parking reservations, automated parking, remote monitoring, energy management, and safety protection. They are widely deployed in urban centers, commercial complexes, hospitals, airports, transportation hubs, and upscale residential communities.

In 2025, global smart multi-Storey parks production reached approximately 1 million parking spaces, with an average global market price is \$2,000 per parking space.

Smart multi-Storey park is a parking solution where electromechanical equipment and a control system replace in-garage driving and manual parking. Drivers hand off vehicles at a transfer bay, and the system automatically stores and retrieves them using lifts, lateral transfers, shuttles, stacker mechanisms, or circulation modules. What makes it smart is not automation alone, but real-time sensing, monitoring, diagnostics, and

scheduling logic that actively manages equipment status, space allocation, and retrieval sequencing?turning parking capacity into an optimizable operational system.

Architectures are commonly differentiated by how vehicles are moved and stored. Lift?slide (puzzle) systems are often favored for adaptability and relatively controlled cost, especially in irregular footprints or retrofit projects. Aisle/stacker and planar-movement solutions are more engineered and typically support higher density in medium-to-large facilities. Vertical lift and circulation-type systems can minimize footprint but are more sensitive to peak throughput, transfer-bay design, and queue management. The practical differentiators are density gain per footprint, peak-hour inbound/outbound throughput, redundancy and uptime, and lifecycle maintenance complexity.

The strongest use cases are high land-value or tightly constrained sites where conventional ramp garages are space-inefficient, and where demand can be managed through operational policies. Benefits include reduced ramps and drive aisles (higher stall density), centralized access and security, and more standardized asset control because storage zones are usually restricted. Constraints typically concentrate in three areas: (1) throughput and user wait time during peaks, governed by transfer bays and cycle times; (2) reliability and maintenance discipline, including recovery strategy, spares, and redundancy; and (3) vehicle envelope compatibility, where conservative size/weight limits can exclude larger vehicles and depress utilization. Because these systems are tightly coupled to civil works, MEP/fire protection, and controls, compliance and acceptance are best engineered upfront with integrated testing and clear emergency procedures.

In practice, smart multi-Storey park is not a standalone equipment purchase. It is an integrated asset spanning structure, MEP/fire systems, controls/software scheduling, and long-term operations?best specified through measurable acceptance criteria (density gain, peak throughput, percentile wait times, availability/redundancy, lifecycle maintenance, and code-compliant operating procedures).
