Abstracts

The global Smart Parking Robot market size is expected to reach \$ 1210 million by 2032, rising at a market growth of 14.6% CAGR during the forecast period (2026-2032).

Smart Parking Robot is an automated parking system designed to enable autonomous vehicle handling, positioning, and slot allocation within structured parking environments. It integrates sensing, navigation, control algorithms, and mechanical lifting mechanisms to improve parking efficiency and maximize space utilization in high-density urban facilities while reducing manual intervention. Its advantages include higher space utilization efficiency, lower labor dependency, improved vehicle turnover rate, and enhanced operational safety. In 2025, the capacity utilization rate was about 70%, and the average gross margin was approximately 20%. Production in 2025 was 16071 units with an average price of 28000 USD per unit. The upstream segment includes servo motors, batteries, drive units, and controllers, with representative suppliers such as Siemens, Bosch, Panasonic, Mitsubishi Electric, Inovance Technology, and CATL. The midstream segment focuses on system integration, navigation algorithm development, mechanical structure engineering, and parking management system integration. The downstream segment is primarily concentrated in public parking facilities and commercial parking operators, with representative customers including Prologis, Simon Property Group, Brookfield Properties, and China Resources Land.

The Robotic Parking system is a fully automatic parking system using robotic technology. With the adoption of AGV technology, users no longer need to look around for empty parking spaces, but simply park their vehicles in the designated chambers and follow the instructions given by the parking and retrieval panel (PRP), the system will proceed the parking automatically.
