According to our (Global Info Research) latest study, the global Smart Toilet IoT Management System market size was valued at US\$ 139 million in 2025 and is forecast to a readjusted size of US\$ 272 million by 2032 with a CAGR of 10.3% during review period.

The Smart Toilet IoT Management System is a comprehensive management system that uses the Internet of Things (IoT), sensors, and a data platform as its core to achieve real-time sensing, centralized management, and intelligent decision-making regarding the operational status of public toilets. This system typically collects real-time toilet usage and environmental data through sensors such as those for counting people, toilet stall occupancy, air quality (ammonia, hydrogen sulfide, etc.), water and electricity consumption, equipment malfunctions, and consumable reserves. This data is then uploaded to a management platform via the network to achieve remote monitoring, automatic alarms, and refined operation and maintenance. Its core value lies in upgrading the traditional toilet management model that relies on manual inspections to a 'data-driven, on-demand service' operation system, thereby improving public health, reducing operation and maintenance costs, and improving the user experience for citizens and tourists. It can be widely used in urban public services, transportation hubs, scenic spots and large public buildings.

As urban management moves towards refinement and digitalization, the smart toilet IoT management system is accelerating its transition from 'pilot applications' to 'large-scale deployment.' Governments at all levels are elevating public health to a crucial component of livelihood projects, driving the intelligent and digital transformation of urban public service facilities. Against the backdrop of the 'toilet revolution,'

'digitalization of urban services,' and the construction of 'smart cities,' the demand for real-time status perception, environmental monitoring, and remote operation and maintenance of public toilets continues to grow, making IoT-based smart toilet management systems a key tool for improving municipal service capabilities. This system not only improves cleaning scheduling efficiency and saves energy and material costs but also enhances citizen satisfaction and the public environment experience.

From a technological and competitive perspective, the smart toilet IoT system is evolving from single data collection to multi-dimensional perception + platform integration + intelligent operation. Leading suppliers are integrating people counting, environmental monitoring, smart sensing devices, and cloud-based big data analytics to provide operators with visual dashboards, predictive maintenance, and automated alarm functions, enhancing system reliability and user experience. Meanwhile, with advancements in edge computing, 5G connectivity, and AI analytics capabilities, these systems are expanding towards higher real-time and predictive service capabilities, further widening the gap with traditional management models. The future market is expected to continue penetrating multiple scenarios, including public services, transportation hubs, scenic area complexes, and commercial complexes, while simultaneously fostering business model innovations centered around service operations and data analytics value-added services.
