The global SMD MOSFET market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A Surface Mount MOS (Metal-Oxide-Semiconductor) Field Effect Transistor (SMT MOSFET for short) is an electronic device used to amplify or switch current. It is a surface-mount packaged MOSFET that is typically mounted on a printed circuit board (PCB) using surface mount technology (SMT) for automated production and assembly in electronic equipment.

SMT MOSFETs use a MOS structure that includes metal electrodes, oxide layers, and semiconductor materials. It usually has three electrodes: a source, a drain, and a gate, and the flow of current between the source and drain is controlled by applying a voltage across the gate. SMT MOSFETs are commonly used in various electronic applications such as power amplification, switching circuits, power management and driving circuits, etc.

Compared with traditional plug-in packages (such as TO-220, TO-92, etc.), SMT MOSFETs are widely used in modern electronic equipment due to their smaller size, lighter weight and higher integration. They are suitable for high-density PCB and SMT production lines, providing higher assembly efficiency and better performance. At the same time, SMT MOSFETs can also be packaged in a variety of forms, such as SOT-23, SOT-223, DPAK, DFN, etc., to meet the needs of different applications.

This report studies the global SMD MOSFET production, demand, key manufacturers, and key regions.
