Abstracts

The global Smoke Control Motor market size is expected to reach \$ 2141 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

A Smoke Control Motor is a dedicated electric motor used in fire protection ventilation systems. It drives smoke exhaust fans or pressurization fans to remove smoke and hot gases from buildings during a fire, or to maintain positive pressure in escape routes to ensure safe evacuation. In 2025, global Smoke Control Motor production reached approximately 7741.6 K Units. The upstream of the smoke control motor industry includes key raw materials and components such as silicon steel, copper windings, bearings, aluminum housings, and high-temperature insulation materials.

Smoke Control Motors are critical driving components in building fire ventilation systems. They are used to power smoke exhaust fans or pressurization fans during fire events, enabling rapid smoke removal and maintaining positive pressure in evacuation routes. These motors are typically required to comply with strict fire safety standards such as EN12101-3 and NFPA, and must operate reliably under high-temperature conditions (200°C-400°C) for a defined duration, making them significantly more technically demanding than standard industrial motors. Structurally, this market is not a standalone consumer motor segment but is deeply embedded within HVAC and fire protection engineering systems. Demand primarily originates from commercial buildings, transportation infrastructure (subways, tunnels, airports), public facilities (hospitals, stadiums), and high-reliability environments such as data centers. The market is characterized by project-based procurement through fan manufacturers and system integrators rather than standardized product sales.

This report studies the global Smoke Control Motor production, demand, key

manufacturers, and key regions.
