According to our (Global Info Research) latest study, the global Smooth Copper Cold Wall market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The smooth copper cold wall is a cooling device used in high-temperature industrial furnaces. It is mainly used to cool the inner wall of the furnace to protect the furnace structure from being eroded by high-temperature furnace gases. Smooth copper cold wall is usually made of copper material with smooth surface and excellent thermal conductivity and corrosion resistance. The working principle of the smooth copper cold wall is to flow the cooling medium (such as water or other coolants) through the cooling pipe inside the cold wall, so that the cooling medium absorbs the heat inside the kiln, thereby reducing the temperature of the inner wall of the kiln. When the cooling medium flows in the cooling pipe, it transfers heat to the cooling medium through contact with the inner wall of the furnace, and then takes away the heat through the circulating flow of the cooling medium, thereby cooling the inner wall of the furnace. The smooth copper cold wall has high thermal conductivity and can quickly transfer the heat inside the kiln to the cooling medium, thereby achieving rapid cooling. At the same time, copper material has good corrosion resistance and can maintain a long service life in high temperature and corrosive gas environments.
