## Abstracts

The global Sodium Hexatitanate market size is expected to reach \$ 352 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

Sodium Hexatitanate ( $\text{Na}_2\text{Ti}_6\text{O}_{13}$ ) is a layered alkali titanate ceramic compound characterized by a tunnel-like crystal structure, high thermal stability, ion-exchange capability, and excellent mechanical reinforcement properties, making it valuable in functional materials, energy systems, and composites. Its supply chain begins upstream with titanium-containing raw materials such as titanium dioxide ( $\text{TiO}_2$ ), titanium slag, or ilmenite, along with sodium sources like sodium carbonate ( $\text{Na}_2\text{CO}_3$ ) or sodium hydroxide ( $\text{NaOH}$ ). These inputs are processed through solid-state reactions or hydrothermal synthesis followed by high-temperature calcination to form sodium hexatitanate powders, fibers, or whiskers. Midstream, manufacturers refine particle size, morphology, and purity depending on application requirements, including surface modification or dispersion treatments. Downstream, the material is integrated into applications such as lithium-ion battery anodes, catalyst supports, friction materials (e.g., brake pads), and high-strength ceramic or polymer composites, with end users spanning automotive, energy storage, environmental catalysis, and advanced materials industries. In 2025, global Sodium Hexatitanate output was about 90,000 tons with 130,000 tons of capacity, average prices of USD 1,800-4,500 per ton, and gross margins around 26%.
