Abstracts

The global Sodium Hydroxymethanesulfonate market size is expected to reach \$ 14.87 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

In 2025, the global sales volume of Sodium Hydroxymethanesulfonate is estimated at approximately 1,930 tons, with the mainstream ex-factory average price at around USD 5.5/kg. The gross margin of major manufacturer is approximately 25%-40%.

Sodium Hydroxymethanesulfonate is a fine chemical containing hydroxymethyl and sodium sulfonate structures, with CAS No. 870-72-4. It is commonly abbreviated as PN in the electroplating intermediate field. The product is usually supplied as a white to off-white powder and can also be supplied in aqueous solution form. It is readily soluble in water and can essentially be regarded as a stable adduct formed from formaldehyde and sodium bisulfite. Its molecular structure contains both hydroxymethyl and sulfonate features, giving it good water solubility, stability and reactivity, and allowing it to function as a water-soluble fine chemical intermediate containing a sulfonate structure in subsequent reaction or formulation system construction.

Its upstream raw material mainly includes formaldehyde, sodium bisulfite, sodium hydroxide, process water, pH regulator, crystallization aid, drying auxiliary and packaging material. Key production requirements include adduct reaction control, purity stability, free formaldehyde control, moisture control, color control and batch-to-batch consistency. In downstream application, the electroplating field mainly uses it as a nickel plating additive intermediate or auxiliary functional raw material to improve plating bath stability and coating performance; in the pharmaceutical and organic synthesis field, it is more commonly used based on its formaldehyde adduct, sulfonate structure

and water-soluble reactive intermediate characteristics, participating in the preparation of pharmaceutical intermediate, fine chemical and functional auxiliary.
