Abstracts

The global Sodium Octatitanate market size is expected to reach \$ 312 million by 2032, rising at a market growth of 7.6% CAGR during the forecast period (2026-2032).

Sodium Octatitanate ($\text{Na}_2\text{Ti}_8\text{O}_{22}$) is a layered alkali titanate compound characterized by its tunnel-like crystal structure, high ion-exchange capacity, thermal stability, and chemical resistance, making it valuable in batteries, catalysts, and functional ceramics. Its supply chain begins with upstream raw materials such as titanium dioxide (TiO_2), sodium carbonate (Na_2CO_3) or sodium hydroxide (NaOH), typically sourced from titanium mineral processors and chlor-alkali producers. In the midstream, manufacturers synthesize sodium octatitanate through high-temperature solid-state reactions or hydrothermal methods, followed by calcination, milling, and surface modification to achieve specific particle sizes and morphologies (e.g., whiskers or powders). Downstream, it is integrated into applications such as lithium-ion battery anode materials, ion-exchange media, reinforcing fillers in polymers, and catalyst supports, with distribution handled by specialty chemical suppliers and advanced materials companies serving electronics, energy storage, and industrial sectors. In 2025, global Sodium Octatitanate output was about 80,000 tons with 110,000 tons of capacity, average prices of USD 2,000–5,000 per ton, and gross margins around 29%.
