Abstracts

The global Sodium Propyl Paraben market size is expected to reach \$ 13.79 million by 2032, rising at a market growth of 3.7% CAGR during the forecast period (2026-2032).

Sodium Propylparaben (CAS No.: 35285-69-9) is a white, hygroscopic powder that serves as a broad-spectrum antimicrobial agent and preservative; it is, specifically, the sodium salt form of propylparaben. Highly soluble in water and alkaline in nature, it is primarily utilized in the food, cosmetics, and pharmaceutical industries to effectively inhibit the growth of molds and yeasts, and is frequently employed in acidic to neutral environments.

The primary upstream raw materials involved in its production are p-hydroxybenzoic acid and n-propanol. These two substances undergo an esterification reaction to yield propylparaben, which subsequently undergoes a salt-forming reaction with sodium hydroxide or sodium carbonate to be converted into its water-soluble sodium salt form. In the midstream manufacturing phase, the core competitive advantage lies in controlling product purity and ensuring the stability of its water solubility.

The market price for Sodium Propylparaben typically ranges from \$8,000 to \$10,500 per ton, with global sales volumes reaching the thousand-ton level. The industry's gross profit margin falls within the range of 20% to 30%.

As a traditional preservative characterized by exceptional performance, low cost, and excellent water solubility, Sodium Propylparaben plays a pivotal role in complex liquid formulations due to its specific efficacy in inhibiting molds and yeasts. In terms of market drivers, the continuous expansion of the global pharmaceutical, food, and personal care sectors?particularly the surging demand for processed foods and long-

acting formulations in developing nations? serves as the primary engine for the product's market growth. However, controversies surrounding the potential endocrine-disrupting risks associated with parabens have prompted regulatory bodies in the EU and North America to repeatedly lower the maximum permissible concentration limits for these substances. This trend has, in turn, driven end-product manufacturers to seek plant-derived or 'additive-free' alternatives, thereby?to a certain extent?constraining the growth potential of the market segment within the daily chemical industry.
