Abstracts

According to our (Global Info Research) latest study, the global Soft Exosuits market size was valued at US\$ 1111 million in 2025 and is forecast to a readjusted size of US\$ 3713 million by 2032 with a CAGR of 18.7% during review period.

In 2025, global Soft Exosuit output reached about 180,000 units and global capacity of around 240,000 units. The average price is about USD 6,000 per unit, with gross margins near 38%. Soft Exosuits are wearable robotic assistive systems made primarily from flexible textiles, cables, elastomers, and lightweight actuators that augment, restore, or support human movement without the rigid frames used in traditional exoskeletons. They are designed to provide biomechanical assistance to joints such as the ankle, knee, hip, shoulder, or back while maintaining comfort, flexibility, and natural motion. Soft exosuits are used in medical rehabilitation, mobility assistance, industrial ergonomics, military load carriage, sports performance enhancement, and elderly care. The supply chain begins with upstream suppliers of advanced textiles, high-strength fibers (e.g., Dyneema, Kevlar), soft sensors, inertial measurement units (IMUs), force sensors, batteries, motors, cable-drive systems, pneumatic or artificial muscle actuators, microcontrollers, and embedded software. Midstream manufacturers integrate these components into wearable systems, develop motion-control algorithms, and conduct biomechanical testing and certification. Downstream channels include hospitals, rehabilitation centers, research institutions, industrial workplaces, defense organizations, sports training facilities, and healthcare providers, where the devices are deployed for mobility assistance, injury prevention, rehabilitation therapy, and human performance augmentation.
