## Abstracts

According to our (Global Info Research) latest study, the global Soil Microbial DNA Testing Service market size was valued at US\$ 9261 million in 2025 and is forecast to a readjusted size of US\$ 16687 million by 2032 with a CAGR of 8.8% during review period.

Soil microbial DNA testing service utilizes high-throughput sequencing and other molecular biology technologies to directly extract and analyze the genetic material (DNA) of microorganisms (bacteria, fungi, archaea, etc.) from soil. This allows for comprehensive identification of microbial community composition, diversity, and functional genes without the need for culturing. Its core function is to transform the soil "black box" into visualized data, solving key problems that traditional methods struggle to assess, such as soil microbial health status, pathogen latent risk, and the impact of fertilization and pesticide application on microbial communities. This provides a scientific basis for decision-making in precision agriculture, soil remediation, and ecological research. The upstream sector comprises the supply of technology, equipment, and consumables, including sequencing instrument manufacturers, laboratory consumable suppliers, and bioinformatics analysis software development companies. The downstream sector directly serves end-user markets, primarily including: 1. Agriculture (large farms, organic plantations, for guiding fertilization and disease control); 2. Research institutions (universities, research institutes, environmental protection departments, for basic research and environmental monitoring); 3. Ecological restoration and consulting companies (for evaluating pollution control effectiveness and land reclamation plans). In 2025, the average price per sample for soil microbial DNA testing services was approximately \$55, with a gross profit margin of approximately 55%.
