Abstracts

The global Soil Moisture Monitoring System market size is expected to reach \$ 270 million by 2032, rising at a market growth of 9.0% CAGR during the forecast period (2026-2032).

A Soil moisture monitoring comprises testing the soil for its water content or for its ability to have water extracted through being squeezed by plant roots (known as soil suction or soil moisture tension) in order to better assess how much or little water is required, in order to avoid wastage.

Moisture monitoring is used to assess whether too much water has been applied to the soil, which can lead to water soaking well below the reach of plant roots, effectively wasting the water used and increasing pumping costs as well as leaching nutrients. Similarly, moisture monitoring can also establish if too little water is being used to irrigate a crop. This can lead to reduced crop yields due to plant stress, salt accumulation in the soil's 'rootzone' (the level at which plants actually compress the soil to extract moisture) and a deterioration in the nutrient quality of the soil.

Global Soil Moisture Monitoring System key players include Campbell Scientific, IMKO, DELTA, ADCON, etc. Global top four manufacturers hold a share over 20%.

USA is the largest market, with a share about 40%, followed by China, and Europe, both have a share over 50 percent.

In terms of product, Tensiometers System is the largest segment, with a share about 30%. And in terms of application, the largest application is Agriculture, followed by Environmental protection, Sandstorm Warning, etc.
