## Abstracts

According to our (Global Info Research) latest study, the global Soil Remediation Solution market size was valued at US\$ 6174 million in 2025 and is forecast to a readjusted size of US\$ 9804 million by 2032 with a CAGR of 6.8% during review period.

Soil remediation solution is a systematic and customized combination of engineering technology and management strategies for contaminated or degraded soils. The goal is to remove, degrade, immobilize, or reduce the concentration and toxicity of pollutants in the soil through physical, chemical, biological, or combined methods, restoring the soil's ecological functions, productivity, and safety to meet specific land use requirements (such as agriculture, residential, industrial, or nature conservation). Demand stems from increasingly stringent environmental regulations, the economic drivers of urban land redevelopment, and the urgent pressure to ensure food security and public health. Its core driving force is mitigating historical pollution risks, releasing land asset value, and restoring ecological functions. Upstream is the technology research and development and equipment/material supply side, including remediation technology patent holders, manufacturers of specialized equipment (such as thermal desorption devices), suppliers of remediation agents (oxidants, stabilizers, microbial agents), and engineering consulting and testing institutions. Downstream is the demand implementation and asset operation side, mainly including polluters (industrial enterprises, mining companies), local governments and land reserve agencies, large farms, and EPC general contractors. The average price of soil remediation solutions in 2025 is approximately US\$100 per cubic meter, depending on the degree of pollution, remediation technology, project scale, and region, with a gross profit margin of approximately 30%.
