According to our (Global Info Research) latest study, the global Soil Stabilization market size was valued at USD 20260 million in 2023 and is forecast to a readjusted size of USD 24220 million by 2030 with a CAGR of 2.6% during review period.

Soil stabilization refers to the process of altering the physical properties of soil through various additives in order to improve strength, compressibility, resistance to softening by water, durability, and other properties. This process is mainly applicable in the building and construction sector, where the properties of soil matter the most for a strong foundation. Road construction projects require specific physical properties of soil to sustain the tensile stresses and strains. Furthermore, this process is also used in the agricultural sector to improve soil structure and the water-holding capacity of the land.

Asia-Pacific accounted for the largest share of global soil stabilization market in 2017. This can be attributed to rapid industrialization and urbanization in major economies such as China and India. In addition, growing awareness about soil management techniques and the increased income of farmers are likely to drive market growth in this region. Also, there are various upcoming infrastructure, road, and hydraulic construction projects in India and China, which is likely to propel the market growth in the coming years.
