Abstracts

The global Solar Street Lights market size is expected to reach \$ 8313 million by 2032, rising at a market growth of 10.0% CAGR during the forecast period (2026-2032).

Solar street lights are raised light sources which are powered by photovoltaic panels generally mounted on the lighting structure or integrated in the pole itself. The photovoltaic panels charge a rechargeable battery, which powers a fluorescent or LED lamp during the night. In 2024, global Solar street lights production reached approximately 11.25 M Units, with an average global market price of around US\$ 331.9 per unit.

Looking at solar street lights in terms of product form, the market for integrated solar street lights is growing, while hybrid streetlight systems combining solar and wind power offer even greater potential for technological integration. Furthermore, path lights and wall lights for gardens and landscapes also hold a significant market share. Intelligence is at the core: Future solar streetlights will no longer be simple lighting devices, but will integrate features such as remote monitoring, automatic brightness adjustment, and fault warnings. They will also integrate with smart city management systems, becoming data collection nodes for urban data. Product form iteration: All-in-one designs, which integrate photovoltaic panels, batteries, LED light sources, and controllers, simplify installation and maintenance and are attracting market attention. Continuous efficiency improvements: Technological advances in LED light sources will continue to enhance luminous efficacy and lifespan. Furthermore, the widespread adoption of high-efficiency solar panels (such as monocrystalline silicon) will further improve energy conversion efficiency and expand the product's application scenarios.
