Abstracts

Solar water pumps can supply water to locations which are beyond the reach of power lines. Commonly, such places relied on human or animal power or on diesel engines for their water supply. Solar water pumps can replace the current pump systems and result in both socio-economic benefits as well as climate related benefits. The water supplied by the solar water pump can be used to irrigate crops, water livestock or provide potable drinking water.

A solar water pump system is essentially an electrical pump system in which the electricity is provided by one or several Photovoltaic (PV) panels. A typical solar powered pumping system consists of a solar panel array that powers an electric motor, which in turn powers a bore or surface pump. The water is often pumped from the ground or stream into a storage tank that provides a gravity feed, so energy storage is not needed for these systems.

According to our (Global Info Research) latest study, the global Solar Water Pumps market size was valued at US\$ 1664 million in 2023 and is forecast to a readjusted size of USD 5824 million by 2030 with a CAGR of 19.8% during review period.
