## Abstracts

According to our (Global Info Research) latest study, the global Solid Diffusion Source market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A solid-state diffusion source is a material used in semiconductor manufacturing to diffuse impurity elements from the solid state into the interior of a semiconductor crystal at a specific temperature to change its electrical properties. Through heating, the impurity atoms in the diffusion source gradually enter the surface of the semiconductor material, penetrate into the crystal structure, and form a doping layer. This method is often used in the doping process of semiconductor materials such as silicon wafers to regulate the conductivity and other properties of the device. Solid-state diffusion sources are stable, uniform, and easy to control, and are a commonly used doping method in the semiconductor production process.
