According to our (Global Info Research) latest study, the global Solid Hydroquinone market size was valued at USD 462 million in 2022 and is forecast to a readjusted size of USD 613.1 million by 2029 with a CAGR of 4.1% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Hydroquinone, with the chemical formula $C_6H_4(OH)_2$, is a compound formed by replacing two para-hydrogens of benzene with hydroxyl groups. Hydroquinone is white needle crystal, flammable, soluble in hot water, ether and ethanol, slightly soluble in benzene. With reductive properties, brown p-benzoquinone can be obtained by mild oxidation, and hydroquinone can be obtained by reduction of p-benzoquinone. The p-benzoquinone-hydroquinone redox couple exists in many biomolecules, such as coenzyme Q and so on. The phenolic hydroxyl hydrogen of hydroquinone has weak acidity, and can lose one or two protons to generate the corresponding phenoxide anion. It is mainly used as reducing agent, developer (reducing silver halide to silver), polymerization inhibitor of monomer (acrylic acid, methyl methacrylate), and skin whitening agent. Hydroquinone ether is a raw material in the production of dyes and fragrances. Hydroquinone is highly toxic, and if an adult takes 1g by mistake, symptoms of poisoning such as headache, dizziness, nausea, and vomiting will appear. It is carcinogenic and mutagenic.
