Abstracts

According to our (Global Info Research) latest study, the global Solid Potassium Formate market size was valued at US\$ 250 million in 2025 and is forecast to a readjusted size of US\$ 347 million by 2032 with a CAGR of 4.6% during review period.

Solid potassium formate is an organic acid potassium salt obtained by neutralization of formic acid and potassium hydroxide, followed by concentration, crystallization, and drying. Its chemical formula is HCOOK and its CAS number is 590-29-4. The product usually appears as white crystals, powder or flakes, with an industrial grade content of 96% to 98%. It has the characteristics of high water solubility, fast liquid preparation speed, low chloride ion content, and biodegradability. Solid products are easy to transport in bags and store for a long time. They can be formulated into potassium formate salt water of different densities on site, mainly used for oil and gas drilling fluids, completion fluids, workover fluids, fracturing fluids, airport snow and ice removal agents. They can also be used for low-temperature heat transfer, agricultural potassium sources, and some industrial chemical formulations.

In 2025, global Solid Potassium Formate production reached approximately 255.67 K MT, with an average global market price of around US\$ 980 per MT. The annual production capacity of solid potassium formate is 350 K MT, with a gross profit margin of about 20%.

Upstream raw materials: formic acid, potassium hydroxide, potassium carbonate, potassium chloride, electrolytic potassium hydroxide, etc.

Downstream applications: oilfield development, snow melting agents, mining operations,

and others.

Raw material costs account for 68%; Labor costs account for 8%; The manufacturing cost accounts for 25% of the total cost.

Solid potassium formate is a fine chemical product with relatively limited scale but strong technical properties. The market demand is mainly driven by two major fields: oil and gas extraction and low-temperature snow melting and de icing. The oil and gas industry is the core market for solid products. Solid potassium formate can flexibly prepare high-density solid free saltwater at the well site, which helps to control wellbore pressure, reduce formation damage, and improve the stability of water sensitive shale. Therefore, it has high application value in deep wells, horizontal wells, high-temperature and high-pressure wells, and offshore oil and gas fields. In the field of airport and special road de icing, more attention is paid to the low corrosiveness, low chemical oxygen demand, and environmental compatibility of products. The tightening of environmental standards is conducive to the gradual replacement of urea, acetate, and some traditional chlorides with formate.

From the perspective of competitive landscape, major global suppliers of potassium formate still mainly focus on liquid products, and there are relatively few enterprises that can stably produce high-purity solid products. The solid market is mainly concentrated in China and India. The focus of enterprise competition is not simply to expand general production capacity, but to control the content of moisture, chloride, iron ions, and insoluble substances, improve particle uniformity, anti caking ability, and rapid dissolution performance. The future growth opportunities mainly come from the development of complex oil and gas wells, on-site dry powder liquid preparation demand, airport operation support in cold regions, and new uses such as chlorine free potassium fertilizers. However, the industry also faces risks such as fluctuations in oil and gas investment cycles, decreased demand for de icing due to warm winters, changes in the cost of formic acid and potassium hydroxide, and the replacement of solid products with liquid potassium formate. Manufacturers with upstream raw material matching, customized purity, stable packaging, and global warehousing capabilities are more likely to obtain long-term orders.
