## Abstracts

The global Solid Potassium Methoxide market size is expected to reach \$ 39.11 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

Solid potassium methoxide is a strong alkaline organic metal compound mainly composed of potassium methoxide, with the chemical formula  $\text{CH}_3\text{OK}$ . It usually appears as a white or off white powder or particle, with strong hygroscopicity and strong reactivity. It is prepared by reacting potassium metal with anhydrous methanol and is a typical alkaline reagent of alkoxides. It is easily soluble in polar organic solvents such as methanol and easily absorbs moisture and carbon dioxide in the air, causing deterioration. Solid potassium methoxide is widely used as a strong base and catalyst in organic synthesis, with common applications including ester exchange reactions, biodiesel preparation, synthesis of pharmaceutical and pesticide intermediates, and regulation of reaction rate and selectivity in fine chemical reaction systems. In 2025, global Solid Potassium Methoxide production reached approximately 4,803 MT, with an average global market price of around US\$ 5,765 per MT. The annual production capacity of solid potassium methoxide is 7,000 tons, with a gross profit margin of about 20%.

The upstream core raw materials are anhydrous methanol and potassium source. In the potassium source industry, it is more common to use potassium hydroxide system for dehydration and refining, and there are also situations where higher cost routes such as metal potassium are used for preparation. In addition, it also relies on supporting inputs such as drying and purification under inert gas protection conditions, packaging lining materials, and hazardous chemical storage and transportation systems.

The downstream mainly focuses on ester exchange and esterification related processes for biodiesel and oil chemical industry, as well as strong base catalysis and condensation reaction systems for pharmaceuticals, pesticides, and fine chemicals. Due to its high sensitivity to moisture and carbon dioxide, it tends to be delivered in the form of methanol solution in many scenarios, and the solid form usually corresponds to stricter drying and sealing requirements.

In terms of cost structure, the raw material end generally accounts for the highest proportion, with potassium sources and anhydrous methanol accounting for about 55% to 75%. Energy and utilities such as dehydration distillation, nitrogen seal drying, and exhaust gas treatment account for about 6% to 12%. Packaging and consumables such as moisture-proof inner barrels, valve seals, and drying agents account for about 5% to 10%. Hazardous chemical regulations and logistics warehousing such as fire compartment storage, hazardous material transportation and insurance account for about 6% to 15%. Labor manufacturing costs, depreciation, and losses account for about 6% to 12%.
