Abstracts

The global Solid Potassium Tert-Butoxide market size is expected to reach \$ 317 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Solid potassium tert butoxide refers to potassium tert butoxide delivered in solid form such as powder, crystal, or particle. It is a strong alkaline organic alkoxide, usually prepared by reacting potassium metal with tert butanol. It has strong hygroscopicity, is prone to rapid reaction with water or acid, and can absorb carbon dioxide to form carbonate impurities. Therefore, it is usually required to be sealed and moisture-proof during storage and use, and operated under inert gas protection; It is mainly used as a strong base and metalizing reagent in organic synthesis and fine chemicals, for reaction steps such as deprotonation, condensation, etherification, and cyclization. It is widely used in pharmaceutical and pesticide intermediates, fine chemicals, and special material synthesis processes. The characteristics of its solid form are high effective content and easy to accurately feed according to equivalent, but it requires higher requirements for moisture-proof sealing, sealed feeding, and hazardous chemical regulation management. In 2025, global Solid Potassium Tert-Butoxide production reached approximately 16.57 K MT, with an average global market price of around US\$ 13,854 per MT. The annual production capacity of solid potassium tert butoxide is 7000 tons, with a gross profit margin of about 20%.

The main upstream raw materials include tert butanol and potassium sources, with potassium sources commonly being metallic potassium or equivalent potassium based raw materials. The supporting materials also include inert gases such as nitrogen, dehydration and drying system consumables, maintenance and depreciation of closed reaction and filtration drying equipment, packaging lining and sealing materials, as well

as hazardous storage and transportation services.

The downstream mainly involves strong base deprotonation, condensation, cyclization, and elimination reactions in the synthesis of pharmaceutical and pesticide intermediates, etherification and metallization reactions in fine chemical and special material synthesis, partial polymerization and organic synthesis catalytic systems, as well as alkaline catalysis scenarios in ester transfer and alcoholysis processes. The customers are mostly pharmaceutical and chemical plants, agrochemical enterprises, fine chemical plants, reagents, and distribution channels with anhydrous inert operation capabilities.

The cost of raw materials usually accounts for 65% to 80% of the total cost, manufacturing expenses account for about 6% to 12%, packaging and hazardous chemical logistics account for about 6% to 15%, quality inspection and document system and manual management account for about 5% to 12%, and environmental safety and compliance and loss disposal account for about 2% to 6%.
