Sonar processing software refers to computer programs or algorithms used for the analysis and interpretation of sonar data collected from underwater environments. Sonar, which stands for Sound Navigation and Ranging, is a technology that uses sound waves to map and detect objects or features underwater. Sonar processing software is designed to process raw sonar data, remove noise and interference, and generate meaningful images, maps, or 3D representations of the underwater surroundings. It is commonly used in various applications, including marine exploration, underwater navigation, fisheries management, underwater archaeology, and military operations. The software plays a crucial role in extracting valuable information from sonar signals, helping users make informed decisions and discoveries in underwater environments.
