According to our (Global Info Research) latest study, the global Sonic Genome Shearing Instrument market size was valued at US\$ 64.5 million in 2024 and is forecast to a readjusted size of USD 85.6 million by 2031 with a CAGR of 4.1% during review period.

The acoustic genome shearing instrument is an advanced analytical instrument, mainly used in research in the fields of biology, basic medicine, clinical medicine, preventive medicine and public health. The acoustic genome shearing instrument is a technological innovation based on traditional ultrasonic processing. It uses a spherical solid-state ultrasonic transducer to focus the sound waves on the sample area in three dimensions. The focused sound waves can obtain good processing effects with energy input at different angles, thus avoiding excessive sample processing and thermal damage that may be caused by the non-aggregation of traditional ultrasonic energy.
