According to our (Global Info Research) latest study, the global Sonoelastography System market size was valued at US\$ 976 million in 2025 and is forecast to a readjusted size of US\$ 1533 million by 2032 with a CAGR of 6.7% during review period.

Ultrasound elastography, also called as sono-elastography, is a modern evolutionary method of sonographic imaging. Techniques include shear wave elastography (also known as transient elastography) and strain elastography (also known as static or compression elastography). These techniques utilize sound waves for assessing the mechanical properties of tissues such as stiffness and elasticity in response to mechanical pressure on tissue. They are used for detecting different pathologies in tissues by using the differences of their aforesaid mechanical properties.
