According to our (Global Info Research) latest study, the global Space Electronics market size was valued at USD 1134.6 million in 2023 and is forecast to a readjusted size of USD 1383.3 million by 2030 with a CAGR of 2.9% during review period.

Space is an extremely hazardous environment with the presence of lethal radiation, micrometeoroids, highly fluctuating temperatures, and man-made debris, which may cause different types of issues for electronic components from simple bit flips to the dangerous complete burnout of electronic systems. The effects produced by the radiation on the space electronics, such as Single Event Effect (SEE) and Total Ionizing Dose (TID), can be rectified by the radiation-hardening process. The process makes the electronic components capable to operate reliably for eons in the harsh space environment but at a very high cost.
